

Input

flat fidelity
 $c \sim i = 0.83$

observable trace
 $T = (s1, ..., sn)$

No latent states are assumed.

SC-FMA: structural calibration layer

Audit graph

dependencies, not rank order

SCU calibration

$[c \sim, n \sim, R, b]$

↓

**preserve signal
regularize structure**

↓

w* calibrated weights

Fixed-budget audit output

audit queue

rank	step	reason	action
1	s3	bottleneck	inspect
2	s2	necessary	verify
3	s5	redundant	defer

audit record = score + reason + action

structural audit fields

fidelity

necessity

redundancy

bottleneck

review action

scalar fidelity score

decomposed, structure-aware audit representation
